

Weather Station Projection Clock with Phone Charger

Form, Fit, and Function!

Our weather station projection clock combines a compact, stylish, and modern design with convenience and utility. The unit comes with a 3-channel wireless remote sensor that broadcasts instantaneous temperature to the central weather station from any room in your house or even outside up to 200 feet away. The station itself has a built-in thermometer that measures room temperature. The weather station connects to the US atomic clock to automatically set the most accurate time and uses a high contrast beam and adjustable lens to project time and temperature onto your ceiling up to 10 feet away. The high contrast integrated display is easy to read with extra large numbers for convenience and shows weather forecasting icons and a multi-lingual calendar. The unit is battery operated or plugs into your wall, preventing time loss during a power outage. The weather station has dual built-in alarms and snooze control. Our weather station's compact design fits on most nightstands and has a built-in USB charger to use with your phone or mobile device.

Wherever Weather!

Features
